

# User-Instructions

Please take a moment to read the [Kilosort 4 paper](#), which is the primary sorting algorithm used. Please also read [Spike Interface Paper](#), which is the open source library the pipeline is built on.

These instructions assume basic familiarity with VS Code, jupyter notebooks, conda environments, and command line interface. If you're unfamiliar, try it anyways! :)

1. Start ec2 instance
    1. See Instructions
  2. SSH into AWS machine
    1. See Instructions
    2. A Laptop will be configured to have easy access to AWS Machine
    3. student@z-lab-ec2
  3. Open "codespace"
  4. Open Notebooks -> z-sort notebook
  5. data lives in the data directory
    1. data is necessarily formatted like this:

<C> – You will need to copy the name of this directory into the notebook  
<P> – You will need to paste the relative path and paste into the notebook, which is done by opening the file navigation bar on the left of VS code, right clicking, and "copy relative path". This path is needed to launch the

## Run jupyter notebook cells in order

**-1. If you just did some sorting, make sure to end the active terminal by pressing control+z**

**0. In between sessions, you *MUST* restart the notebook, otherwise you will get phantom data** 🤡

❖ Generate + Code + Markdown | ⚡ Run All ⚡ Restart ✖ Clear All Outputs | 📁 Jupyter Variables

## Sorting Notebook

This notebook will download and sort electrophysiology collected using an Intan headstage, in the .r1

The data is intracranial mouse recording, from a 16 channel microarray. The paper can be found here  
<https://doi.org/10.1371/journal.pone.0221510>

❖ Generate + Code + Markdown

## 1. Activate conda environment

### # Getting Set Up

1. Open a terminal. Make sure "Sorter" environment is active by running these commands in the terminal

```
...
conda deactivate
conda activate sorter
...
```

○ (sorter) **marco@ip-172-31-78-229:~/codespace/sorting\_script\$** **conda deactivate**  
**conda activate sorter**

## 2. import lab script

```
# 2. Import scripts
from sorting_scripts import zsort
```

✓ 0.6s

## 3. Set Patient and Session Paths

```
# 3. Set Patient and Session Paths
patient = "Intan_RDH_2000"
session = "Session1"

path_dict = zsort.set_paths(patient, session)
path_dict
```

✓ 0.0s

1

Found Intan file: [/data/Intan\\_RDH\\_2000/Session1/raw/Intan](/data/Intan_RDH_2000/Session1/raw/Intan) RHD file1.rhd

```
{'patient': 'Intan_RDH_2000',
'session': 'Session1',
'repo_root': PosixPath('/home/marco/codespace/sorting_script'),
'data_root': PosixPath('/data'),
'session_location': PosixPath('/data/Intan_RDH_2000/Session1'),
'sorted_data': PosixPath('/data/Intan_RDH_2000/Session1/Intan_RDH_2000-Session1-sorted'),
'sorter_output_folder': PosixPath('/data/Intan_RDH_2000/Session1/Intan_RDH_2000-Session1'),
'analyizer_folder': PosixPath('/data/Intan_RDH_2000/Session1/Intan_RDH_2000-Session1-sort'),
'intan_file': PosixPath('/data/Intan_RDH_2000/Session1/raw/Intan RHD file1.rhd')}
```

## 4. Load File

```
▶ # 4. Load File  
  
import spikeinterface.full as si  
  
recording_path = path_dict["intan_file"]  
  
rec = si.read_intan(recording_path, stream_id = "0")
```

✓ 0.2s

## 5. Set Probe

```
▶ # 5. Set Probe  
probe = "neuronexus-A16x1_2mm_50_177_A16.json"  
rec = zsort.set_probe(rec, path_dict, probe)
```

[4] ✓ 0.1s

... no probe, attaching one

## 6. Sort

```
▷ ▾ # 6. Sort

      sort = zsort.sort(rec, path_dict)
[5] ✓ 1m 22.6s

waveform

waveformheatmap

This is the trace of the selected spike, with one trace per nearby electrode

This is the auto-correlogram, which shows a histogram of the intervals between detected spikes. Because of a neurons refractory period, a single unit should show a significant dip around 0ms.

e

This shows the location of each electrode on the probe in 2D space. The small dots are the electrodes, the larger colored dots are putative spikes.

Once all of the spike qualities have been input, you can sort the table so the "good" units are near each other, to seem them all super imposed. If the spikes line up, select those two using "control + click", so see them on top of each other.

Sort by quality, and select all to see them superimposed on one another. Based on this view, 19 & 6 may be a single unit, and 3 & 28 may be a single unit. Lets drill into those.

Taking a closer look, we can see the traces stacked on top of each other, each autocorrelogram, and a cross correlogram. The cross correlogram shows that there are no spikes within 20 ms of one another between the two units, suggesting they should be merged.

toggle the units in question to "visible", select both, and press merge. The new merge group will appear

**All units: 32 - visible: 2 - selected: 2**

unit_id	visible	quality	channel_id	sparsity	firing_ra

28	X	good	A-014	4	6.92730
3	✓	good	A-007	5	0.71490

Noise units can be deleted. They are not gone forever, they just leave a cleaner curation object.

Once everything is completed to your satisfaction, select "save in analyzer". This will create a hidden curation file.

## 10. Save Curated Data

Return to the notebook, and run the final cell so create a curated dataset. If you look in "data<patient<session<sorted" you will see a file ending in `*.zarr`. This is the final product of your sorting efforts, it contains the curated data.

**11. You're done! 🎉 Be sure to end the process in the terminal with Control+Z, and restart the notebook kernel**

The screenshot shows a Jupyter Notebook interface. At the top, there's a toolbar with icons for download, generate, code, markdown, run all, restart, clear all outputs, and Jupyter variables. Below the toolbar, a section header reads "Sorting Notebook". A text block below it says: "This notebook will download and sort electrophysiology collected using an Intan headstage, in the .rl format. The data is intracranial mouse recording, from a 16 channel microarray. The paper can be found here <https://doi.org/10.1371/journal.pone.0221510>". There are also three buttons at the bottom of this section: "Generate", "Code", and "Markdown".
